

# ABATE

## Have your memory or thinking abilities declined in the last few months?

The ABATE clinical research study is evaluating the effects of a vaccine (ACI-24.060) in people developing impairment in cognition.

If you are between 50 and 75 years old, you may want to consider participating in the ABATE research study and contribute to scientific discovery.

### ACI-24.060

is a study vaccine designed to make your body generate natural immunity (antibodies) against amyloid-beta protein, which is believed to play an important role in cognitive decline in Alzheimer's disease.

To learn more about this research study, please contact the study team:
